Fortify Security Report

Jun 30, 2015

dmcallaster

Executive Summary

Issues Overview

On Jun 30, 2015, a source code review was performed over the tf-ads-bpa code base. 392 files, 3,500 LOC (Executable) were scanned and reviewed for defects that could lead to potential security vulnerabilities. A total of 117 reviewed findings were uncovered during the analysis.

Issues by Fortify Priority Order	
Low	99
High	17
Critical	1

Recommendations and Conclusions

The Issues Category section provides Fortify recommendations for addressing issues at a generic level. The recommendations for specific fixes can be extrapolated from those generic recommendations by the development group.
Results Outline
Overall number of results

The scan found 117 issues.

Vulnerability Examples by Category
Fortify Priority Order: High (17 Issues)

Abstract:

The program can potentially fail to release a system resource.

Explanation:

The program can potentially fail to release a system resource.

Resource leaks have at least two common causes:

- Error conditions and other exceptional circumstances.

- Confusion over which part of the program is responsible for releasing the resource.

Most unreleased resource issues result in general software reliability problems, but if an attacker can intentionally trigger a resource leak, the attacker might be able to launch a denial of service attack by depleting the resource pool.

Example: The following method never closes the file handle it opens. The finalize() method for FileInputStream eventually calls close(), but there is no guarantee as to how long it will take before the finalize() method will be invoked. In a busy environment, this can result in the JVM using up all of its file handles.

private void processFile(String fName) throws FileNotFoundException, IOException {

FileInputStream fis = new FileInputStream(fName);

int sz;

byte[] byteArray = new byte[BLOCK_SIZE];

while ((sz = fis.read(byteArray)) != -1) {

processBytes(byteArray, sz);

}

}

Recommendations:

1. Never rely on finalize() to reclaim resources. In order for an object's finalize() method to be invoked, the garbage collector must determine that the object is eligible for garbage collection. Because the garbage collector is not required to run unless the JVM is low on memory, there is no guarantee that an object's finalize() method will be invoked in an expedient fashion. When the garbage collector finally does run, it may cause a large number of resources to be reclaimed in a short period of time, which can lead to "bursty" performance and lower overall system throughput. This effect becomes more pronounced as the load on the system increases.

Finally, if it is possible for a resource reclamation operation to hang (if it requires communicating over a network to a database, for example), then the thread that is executing the finalize() method will hang.

2. Release resources in a finally block. The code for the Example should be rewritten as follows:

public void processFile(String fName) throws FileNotFoundException, IOException {

```
FileInputStream fis;
try {
fis = new FileInputStream(fName);
int sz;
byte[] byteArray = new byte[BLOCK_SIZE];
while ((sz = fis.read(byteArray)) != -1) {
processBytes(byteArray, sz);
}
}
finally {
if (fis != null) {
safeClose(fis);
}
}
}

public static void safeClose(FileInputStream fis) {
if (fis != null) {
try {
fis.close();
} catch (IOException e) {
log(e);
}
}
}
```

This solution uses a helper function to log the exceptions that might occur when trying to close the stream. Presumably this helper function will be reused whenever a stream needs to be closed.

Also, the processFile method does not initialize the fis object to null. Instead, it checks to ensure that fis is not null before calling safeClose(). Without the null check, the Java compiler reports that fis might not be initialized. This choice takes advantage of Java's ability to detect uninitialized variables. If fis is initialized to null in a more complex method, cases in which fis is used without being initialized will not be detected by the compiler.

swagger-ui.min.js, line 5 (Insecure Randomness)

Fortify Priority:	High	Folder	High
Kingdom:	Security Features		
Abstract:	Standard pseudo-random number generators cannot withstand cryptographic attacks.		
Sink:	swagger-ui.min.js:5 FunctionPointerCall()

Abstract:

Interpreting user-controlled instructions at run-time can allow attackers to execute malicious code.

Explanation:

Many modern programming languages allow dynamic interpretation of source instructions. This capability allows programmers to perform dynamic instructions based on input received from the user. Code injection vulnerabilities occur when the programmer incorrectly assumes that instructions supplied directly from the user will perform only innocent operations, such as performing simple calculations on active user objects or otherwise modifying the user's state. However, without proper validation, a user might specify operations the programmer does not intend.

Example: In this classic code injection example, the application implements a basic calculator that allows the user to specify commands for execution.

```
...
userOp = form.operation.value;
calcResult = eval(userOp);
...
```

The program behaves correctly when the operation parameter is a benign value, such as "8 + 7 * 2", in which case the calcResult variable is assigned a value of 22. However, if an attacker specifies languages operations that are both valid and malicious, those operations would be executed with the full privilege of the parent process. Such attacks are even more dangerous when the underlying language provides access to system resources or allows execution of system commands. In the case of JavaScript, the attacker can utilize this vulnerability to perform a cross-site scripting attack.

Recommendations:

Avoid dynamic code interpretation whenever possible. If your program's functionality requires code to be interpreted dynamically, the likelihood of attack can be minimized by constraining the code your program will execute dynamically as much as possible, limiting it to an application- and context-specific subset of the base programming language.

If dynamic code execution is required, unvalidated user input should never be directly executed and interpreted by the application. Instead, a level of indirection should be introduced: create a list of legitimate operations and data objects that users are allowed to specify, and only allow users to select from the list. With this approach, input provided by users is never executed directly.

angular-smooth-scroll.js, line 151 (Dynamic Code Evaluation: Code Injection)

Fortify Priority:	Critical		Folder	Critical
Kingdom:	Input Validation and Representation			
Abstract:	The file angular-smooth-scroll.js interprets unvalidated user input as source code on line 151. Interpreting user-controlled instructions at run-time can allow attackers to execute malicious code.			
Source:	angular-smooth-scroll.js:106 Read ~localScope.location()			

```
104              }
105              location = Math.max(location - offset, 0);
106              return location;
107          };
```

| Sink: | angular-smooth-scroll.js:151 setInterval(0) |
